MagneGrip introduces redesigned exhaust extraction system elbow

8/31/05

MagneGrip exhaust extraction systems have introduced a redesigned nozzle-assembly elbow that enables its systems to operate more efficiently.

The aluminum elbow is now five inches in diameter, which improves airflow because it is the same size opening as most fire apparatus tailpipes. The redesigned elbow also has an improved angle that provides greater airflow efficiency and less static pressure. In addition, MagneGrip's standard, heavy-duty hoses have five-inch diameters.

The new elbow design—along with MagneGrip's patented nozzle that features ambient air intake—add years of reliable operation to the system by decreasing the wear on hoses by hot exhaust emissions.

Your Total Solution for Exhaust Removal & Air Purification
